

PROJECT DOCUMENTATION REPORT

SleepTrack: A Technology-Enabled Solution for Better Sleep Habits Among Students

1. Introduction

Poor sleep habits are a common problem among students. Academic workloads, irregular schedules, and excessive use of smartphones and other digital devices at night can cause students to sleep later than intended. This may lead to daytime tiredness, difficulty concentrating, and reduced productivity.

2. Identified Problem

The frequent use of technology before bedtime can negatively affect students' sleep routines. Social media, online games, streaming, notifications, and academic activities may encourage students to stay on their devices instead of preparing for sleep.

3. Proposed IT Solution

SleepTrack is a proposed mobile application designed to help students develop healthier sleep habits. It allows users to monitor their sleep schedule and manage nighttime device use through reminders and alerts.

4. Main Features

- **Sleep Monitoring** – Records sleeping and waking times.
- **Bedtime Reminders** – Reminds users when it is time to prepare for sleep.
- **Screen-Time Alerts** – Notifies users when they continue using their device near bedtime.
- **Sleep Mode** – Helps reduce unnecessary notifications during scheduled sleep hours.
- **Sleep Dashboard** – Displays daily and weekly sleep patterns.
- **Sleep Tips** – Provides simple recommendations for better sleep habits.

5. How It Works

The student sets a preferred bedtime and wake-up time. SleepTrack monitors the user's sleep schedule and provides reminders as bedtime approaches. If the student continues using the device, the application sends a screen-time alert. Users can then review their sleep patterns through the dashboard and make adjustments to their routine.

6. Expected Benefits

SleepTrack is expected to help students:

- Develop consistent sleep routines
- Reduce unnecessary nighttime screen use
- Become more aware of their sleeping patterns
- Improve their daily study and rest habits
- Practice more responsible technology use

7. Conclusion

SleepTrack provides a simple technology-based solution to poor sleep habits among students. By combining sleep monitoring, bedtime reminders, screen-time alerts, and sleep tips, the application encourages students to manage their technology use and prioritize healthy sleep.

Project Goal:

Less Screen Time at Night. Better Sleep. Better Days.
